

# MOTH RESISTANCE

Long-term protection

Odourless

Safe for people

Safe for animals

## Resistance as standard

To ensure your beautiful Ulster carpet remains that way for as long as possible we add protection to avoid potential damage caused by moths.

Our Wilton and Axminster carpets are treated with a moth proof repellent as standard while our tufted carpets include a moth resistant treatment.

These treatments are not included in our Natural Choice range.

## Why is it needed?

In certain environments and geographic locations, materials with a high wool content, like our carpets, can be at risk of damage from moth larvae.

## How does it work?

Depending on the type of carpet, we add the moth repellent or moth resistant treatment during our dyeing process.

This method penetrates the entire carpet pile to provide long-term protection from both moth larvae and moths.

## Is it safe?

Yes. The moth protection treatment that we use is odourless and non-irritating, making it perfectly safe for people and animals.

## Will it last?

Our research shows that adding the treatment during the dyeing process provides long-term resistance that will remain in place for the normal life cycle of your carpet.

## Added advantages

Wool provides a wide range of natural advantages.

Not only is it not suited to dust mites and does not promote bacteria growth, wool's natural filtering effect makes it perfect for people with asthma or allergies.

Wool naturally absorbs humidity and Volatile Organic Compounds (VOCs) to produce a cleaner, more comfortable living environment. The wonderful natural material is also hygienic and non allergenic.
